

Problem Statement :

- Problem Definition Traditional e-commerce systems often rely on application-layer logic, making it difficult to enforce business rules consistently. This can result in data inconsistency, incorrect inventory updates, unauthorized changes, and weak audit tracking.
- Context of Use The system is designed for online retail businesses that require secure database transactions, automatic inventory management, and reliable auditing of critical operations.
- Target Users:
 - Customers
 - Sales Staff
 - Inventory Managers
 - Database Administrators
- Project Objectives
 - Automate business logic using PL/SQL.
 - Enforce business rules with database triggers.
 - Secure sensitive operations through audit logging.
 - Maintain accurate inventory records
 - Improve transaction reliability and data integrity.
